

ABSTRACT

A host structure for notebook computers includes a bottom member and a top member. The bottom member houses electronic elements such as main board, connectors, battery and the like. The top member is coupled on the bottom member to form a notebook computer host. The bottom member is a standardized member. The top member may be redesigned according to requirements so that the bottom member may be coupled with the top member of different designs to form new notebook computer host models. Thereby vendor's development time for the new notebook computer models may be greatly shortened.
